Difference between std::set and std::list

Difficulty Level : Basic ● Last Updated : 17 Nov, 2020

Set: Set is a type of [associative container](#) which stores elements in a sorted manner. All the elements of a set are unique and can not be modified but can be removed or inserted. It is a template of [Standard Template Library or STL](#) in [C++](#).

Syntax:

```
set <data_type> s
```

Below is the program to illustrate the same:

C++

```
// C++ program to demonstrate the
// working of set in c++
#include <bits/stdc++.h>
using namespace std;

// Driver code
int main()
{
    // Declaring a set
    set<int> s;

    // Inserting elements
    // into the set
    s.insert(10);
    s.insert(5);
    s.insert(15);
    s.insert(1);

    // Insert the duplicate elements
    s.insert(1);

    cout << "Elements in set:\n";

    // Print the element stored in set
```

[Got It !](#)

```
    return 0;  
}
```

Output:

Elements in set:
1 5 10 15

List: The list is a type of [sequence container](#) in which elements are stored in [non-contiguous memory allocation](#). It is implemented as a [doubly-linked list](#) so it provides iteration in both directions.

Syntax:

```
list <data_type> l;
```

Below is the program to illustrate the same:

C++

```
// C++ program to demonstrate the  
// working of list in cpp  
#include <bits/stdc++.h>  
using namespace std;  
  
// Driver code  
int main()  
{
```

```

// Inserting elements
// in the list
l.push_back(10);
l.push_back(15);
l.push_back(5);
l.push_back(1);
l.push_back(1);
l.push_back(10);

cout << "Elements in list:\n";

// Print the elements of list
for (auto it : l)
    cout << it << " ";

return 0;
}

```

Output:

```

Elements in list:
10 15 5 1 1 10

```

Below is the tabular difference between the set and list:

As seen in the above codes, after inserting the values {10, 5, 15, 1, 1} in the set, the elements get sorted and duplicate is not stored in the set. Hence, it is unordered. But in the case of the list the elements are exactly stored in the order they were inserted and duplicate is also stored. Hence, it is ordered.

S.No.	Set	List
1	Set is sorted and unordered	The list is unsorted and ordered
2	Insertion cannot be done at the desired position	Insertion can be done at any position using the insert() function
3	Takes logarithmic time for searching an element.	Takes linear time for searching for an element.
4	Elements are unique.	May contain duplicate elements.
5	Can contain only one null value.	Can contain more than one null value.

- | | | |
|---|---|---|
| 6 | Insertion and deletion take logarithmic time. | Insertion and deletion take constant time. |
| 7 | Implemented in HashSet, LinkedHashSet, and TreeSet. | Implemented in ArrayList and LinkedList . |
